SecureMe - Install & Licence Guide for RDT Staff

Create the company, set the licence at your agreed price, and install in minutes.

The whole job, in short

(1) In the console: create the company, set its licence (quantity + the price you agreed), and generate an install code. **(2)** On each PC: run the installer once and enter that code. About 5 minutes per computer.

Part 1 - In the console

Open https://secureme.realdatatech.ae/console and sign in with your RDT email and password, then click **Companies**.

1 **Create the company with its licence**

In **Add a company**, fill in the name and the client's email domain, then under **Licence**:

- Choose a **Free trial** (1, 2 or 3 months), or a **Paid licence** of 1 to 5 years.
- For a paid licence, set **Devices** (the quantity - bulk is fine) and type the **price per device / year you agreed**. There is no fixed price list: the price is whatever you and the client agreed. 0 = free.
- Click **Create company**. The company and licence are created together and active at once.

2 **Generate the install code**

Click **Open** on the new company, then **Code generator** > **Generate install code**. Copy the code (looks like XXXX-XXXX-XXXX-XXXX).

Each PC that installs with this code automatically joins this company and uses its licence. To change the licence later (more seats, new term/price), open the company and use its **Licence** page.

Part 2 - Install on the PC (from this zip - nothing to download)

Everything you need is already in this folder. Two ways, both end with a green all-PASS self-test:

Easiest - double-click

1

Run the installer

- Double-click **Install SecureMe** in this folder.
- If a blue “Windows protected your PC” box appears, click **More info** then **Run anyway** (it appears only because the file is new and not yet code-signed; SecureMe is safe).
- Click **Yes** when Windows asks for permission.
- Type the company's **install code** when asked, and press Enter.
- Wait for every line to say **PASS**, then close the window.

For many PCs / silent - the .msi

1

Use the MSI (in the “For IT teams” folder)

For Intune, Group Policy, an RMM tool, or a quick silent install, run as administrator:

```
msiexec /i SecureMe-Agent-1.0.6-x64.msi SERVER=https://secureme.realdatatech.ae
CODE=THE-CODE /qn
```

If Microsoft Defender or SmartScreen is aggressive on a PC (because SecureMe is not code-signed yet), run this once as administrator, then install again: Add-MpPreference -ExclusionPath "C:\Program Files\SecureMe"

Part 3 - Running a virus scan

SecureMe uses the computer's own **Microsoft Defender** engine for scanning - powerful, and light because nothing heavy is installed. There are two ways to scan on demand:

- **On the PC:** right-click the **SecureMe icon** next to the clock and choose **Run virus scan**. The result appears under **SecureMe status** a few minutes later.
- **From the console:** open the company > **Devices** > a device > **Quick scan now** or **Full scan**. The result shows under **Protection** on that device, and anything found is reported to your team.

SecureMe does not change Defender's settings; Defender removes threats itself. SecureMe also checks new files in Downloads and on the Desktop against its signed known-threat list, on top of its phishing, link and email protection.

Changing or removing a company

- On **Companies**, each row has **Modify** (name, domains, add a contact) and **Delete** (removes the company and all its data - asked to confirm; your own RDT company cannot be deleted).

Check it worked

- Company > **Devices**: the PC appears within a minute.
- The installer's self-test showed all **PASS** (enrolled, server reachable, licence valid, block list applied).
- The **Licence** page shows the seat in use and the licence active.

The installer shows “build 46” - that is normal. It is the stable installer kept unchanged so Windows trusts it; the agent updates itself to the newest build within a minute of running.
