SecureMe
by Real Data Technology MSP

Install SecureMe on a Mac

macOS on Intel and Apple silicon. About three minutes.

What SecureMe is

SecureMe is a lightweight security tool from Real Data Technology MSP. It stands between you and the scam: before a dangerous link opens, SecureMe checks where it really goes. If it is a trap, you see a clear warning instead of the fake page, and your security team is told.

How it protects you

- **Scam and phishing links.** Every link you click is checked before it opens: in email, in WhatsApp Web and on any web page. A dangerous page is replaced by a red "SecureMe stopped this page" screen.
- **Fake sign-in pages.** If a page pretends to be Microsoft, Google or your bank and asks for your password, SecureMe warns you before you type it.
- **Phishing and payment-fraud email.** When your company connects Microsoft 365 or Google Workspace, incoming mail is checked for fake senders, look-alike domains and "urgent payment" tricks.
- **Blocked sites on the whole computer.** The agent blocks the sites on your company's block list for every program, not only the browser.
- **Your security team behind you.** Every stop is recorded with the reasons. If a computer is at risk it can be cut off from the network in one click, and released again.

Before you start

- The password of an administrator account on this Mac.
- An internet connection.

No code to enter. Just run the installer: this computer connects on its own and protection starts automatically with a free trial. Your Real Data Technology contact activates the licence online afterwards — nothing needs to be typed on the computer. (If your administrator gave you an install link or code, it is used automatically; there is still nothing to type.)

Install: the easy way, with the zip

1 **Download and extract**

Go to **https://secureme.realdatatech.ae**, download **SecureMe-1.0.6-macOS.zip** and double-click it to extract. It contains both the Intel and the Apple silicon version; the installer picks the right one.

2 **Run the installer**

In the extracted folder, right-click **Install SecureMe.command** and choose **Open**, then **Open** again if macOS asks. A Terminal window appears.

3 **Enter your Mac password**

Enter your Mac password when asked (nothing shows while you type). There is nothing else to type — protection starts on its own.

If macOS will not open the file: open Terminal, type **sudo bash** and a space, drag **install.sh** from the folder into the window, and press Return.

Or install with two lines in Terminal

1 **Open Terminal**

Press **Command + Space**, type **Terminal** and press Return.

2 **Paste these two lines, one after the other**

```
curl -fsSLO https://secureme.realdatatech.ae/downloads/install-macos.sh
sudo bash install-macos.sh https://secureme.realdatatech.ae YOUR-CODE
```

The second line asks for your Mac password. Nothing appears while you type it; press Return when done.

3 **Read the result**

You should see **Enrolled with** your company name, then **background service registered and started**, then a short status block.

If macOS says the program "cannot be opened" or is from an "unidentified developer": stop there and send the exact wording to support@realdatatech.ae. The Mac version is not yet signed with an Apple Developer certificate.

Check it worked

```
sudo secureme-agent selftest
```

Every line should start with **PASS** and it should end with **0 problem(s)**. Within a minute the Mac also appears as online on the Devices page of the console.

What you will notice day to day

Almost nothing. SecureMe works silently in the background. You only see it when it stops something, and the browser guard (a separate small download, with its own guide) is what shows you the warning screen.

Browsers on a Mac: the browser guard works in Chrome and Edge. Safari is not supported yet, so use Chrome or Edge for work email and WhatsApp Web.

Updates

Nothing to do. The agent checks for a newer version about once a minute and updates itself. It only accepts an update that is signed by your SecureMe server.

SecureMe is protected

SecureMe cannot be removed or switched off from the computer. This keeps the protection in place even if someone is tricked into trying. If it must be removed, your security team does it for you, or gives you a one-time removal code. Contact **support@realdatatech.ae**.

```
sudo secureme-agent remove --code CODE
```

If something goes wrong

What you see	What to do
"Run with sudo."	Start the second line with the word sudo, exactly as shown.
"Enrolment code is not valid"	Check the code with your administrator.
"Checksum mismatch. Not installing."	The download was damaged or altered. Try again; tell support if it repeats.
selftest shows a FAIL line	Copy the whole selftest output and send it to support@realdatatech.ae.

Help and emergencies

In an emergency (a password typed into a fake page, a payment made to a fraudster, a computer behaving strangely): in the browser guard click **Emergency: get help now**. It goes to the top of the SecureMe security team's screen.

For anything else, email **support@realdatatech.ae** or use **Contact support** at the bottom right of https://secureme.realdatatech.ae. If a step fails, copy the exact message you see and include it.
