Check a message on your phone

The SecureMe message checker for Android and iPhone.

What it does

Scam messages on WhatsApp and SMS often arrive on your phone. The message checker lets you ask SecureMe "is this safe?" before you tap anything. You paste the message, or on Android share it, and get an answer in seconds with the reasons.

> The checker works **when you ask it**. It does not block messages or links on your phone automatically, and it cannot see your messages unless you paste or share one.

Set it up once

1. **Open the checker**
   On your phone's browser go to:

   ```
   https://secureme.realdatatech.ae/m
   ```

2. **Connect**
   Enter your enrolment code and your name, then tap **Connect this phone**.

3. **Add it to your home screen**
   Android (Chrome): menu (three dots) > Add to Home screen.
   iPhone (Safari): Share button > Add to Home Screen.

Check a message

- **Any phone:** copy the suspicious message, open SecureMe, paste it and tap **Check message**.
- **Android:** press and hold the message in WhatsApp, tap Share, and choose SecureMe.
- Red means dangerous: do not tap the link or reply, and delete the message. Your security team is told automatically.
- Green means no warning signs were found. That is not proof the message is genuine: if it asks for money, a code or a password, call the sender first.

Help and emergencies

In an emergency (a password typed into a fake page, a payment made to a fraudster, a computer behaving strangely): in the browser guard click **Emergency: get help now**. It goes to the top of the SecureMe security team's screen.

For anything else, email **support@realdatatech.ae** or use **Contact support** at the bottom right of https://secureme.realdatatech.ae. If a step fails, copy the exact message you see and include it.
