SecureMe
by Real Data Technology MSP

Install SecureMe on Windows

Windows 10, Windows 11 and Windows Server. About three minutes.

What SecureMe is

SecureMe is a lightweight security tool from Real Data Technology MSP. It stands between you and the scam: before a dangerous link opens, SecureMe checks where it really goes. If it is a trap, you see a clear warning instead of the fake page, and your security team is told.

How it protects you

- **Scam and phishing links.** Every link you click is checked before it opens: in email, in WhatsApp Web and on any web page. A dangerous page is replaced by a red "SecureMe stopped this page" screen.
- **Fake sign-in pages.** If a page pretends to be Microsoft, Google or your bank and asks for your password, SecureMe warns you before you type it.
- **Phishing and payment-fraud email.** When your company connects Microsoft 365 or Google Workspace, incoming mail is checked for fake senders, look-alike domains and "urgent payment" tricks.
- **Blocked sites on the whole computer.** The agent blocks the sites on your company's block list for every program, not only the browser.
- **Your security team behind you.** Every stop is recorded with the reasons. If a computer is at risk it can be cut off from the network in one click, and released again.

Before you start

- An account that can "Run as administrator".
- An internet connection.

No code to enter. Just run the installer: this computer connects on its own and protection starts automatically with a free trial. Your Real Data Technology contact activates the licence online afterwards — nothing needs to be typed on the computer. (If your administrator gave you an install link or code, it is used automatically; there is still nothing to type.)

Install: the easy way

1. **Download**
   Open the install link your administrator sent you and click the download button. (No link? Go to **https://secureme.realdatatech.ae** and download **SecureMe-1.0.6-Windows.zip**.)
2. **Extract**
   Open the downloaded zip, click **Extract all**, then **Extract**.
3. **Run the installer**
   Double-click **Install SecureMe**. If a blue box says "Windows protected your PC", click **More info**, then **Run anyway**. Click **Yes** when Windows asks for permission.

4 **Wait for PASS**

A black window connects the PC and runs a self-test. Every line should say **PASS**. There is nothing to type.

The folder **For IT teams** inside the zip holds the MSI for silent deployment. Double-clicking the MSI only copies the program; it does not connect the PC to a company.

Or install with one line in PowerShell

1 **Open PowerShell as administrator**

Click Start, type **PowerShell**, right-click **Windows PowerShell** and choose **Run as administrator**. Click Yes.

2 **Paste this one line and press Enter**

```
iwr https://secureme.realdatatech.ae/downloads/install-windows.ps1 -OutFile
$env:TEMP\sm.ps1; & $env:TEMP\sm.ps1 -Server https://secureme.realdatatech.ae -Code
YOUR-CODE
```

It is one line, shown wrapped. It downloads the agent, checks the file is genuine, connects this PC to your company and starts SecureMe in the background.

3 **Read the result**

You should see **Enrolled with** your company name, then **background service registered and started**, then a short status block.

If Windows shows "Windows protected your PC" or "unknown publisher": the files are not yet code-signed. Choose **More info**, then **Run anyway**, and tell support@realdatatech.ae the exact wording you saw.

Check it worked

```
& "C:\Program Files\SecureMe\secureme-agent.exe" selftest
```

Every line should start with **PASS** and it should end with **0 problem(s)**. Within a minute the PC also appears as online on the Devices page of the console.

For IT teams: silent install with the MSI

For Intune, Group Policy or an RMM tool, download **SecureMe-Agent-1.0.6-x64.msi** and run:

```
msiexec /i SecureMe-Agent-1.0.6-x64.msi SERVER=https://secureme.realdatatech.ae
CODE=YOUR-CODE /qn
```

Without SERVER and CODE the MSI only copies the files; then run the agent's **setup** command as administrator:

```
& "C:\Program Files\SecureMe\secureme-agent.exe" setup --server
https://secureme.realdatatech.ae
```

What you will notice day to day

Almost nothing. SecureMe works silently in the background. You only see it when it stops something, and the browser guard (a separate small download, with its own guide) is what shows you the warning screen.

Updates

Nothing to do. The agent checks for a newer version about once a minute and updates itself. It only accepts an update that is signed by your SecureMe server.

SecureMe is protected

SecureMe cannot be removed or switched off from the computer. This keeps the protection in place even if someone is tricked into trying. If it must be removed, your security team does it for you, or gives you a one-time removal code. Contact **support@realdatatech.ae**.

```
& "C:\Program Files\SecureMe\secureme-agent.exe" remove --code CODE
```

The line above works only with a code from your security team. SecureMe appears in Windows Settings > Apps without an Uninstall button.

If something goes wrong

What you see	What to do
"Open PowerShell with Run as administrator"	Close the window and open PowerShell as administrator (step 1).
"Enrolment code is not valid"	Check the code with your administrator. It is letters and digits in four groups, for example ABCD-EFGH-JKLM-NPQR.
"Licence limit reached" or "no active licence"	Your company needs more seats or a renewal. Contact support@realdatatech.ae.
"Checksum mismatch. Not installing."	The download was damaged or altered. Try again on another network, and tell support if it repeats.
selftest shows a FAIL line	Copy the whole selftest output and send it to support@realdatatech.ae.

Help and emergencies

In an emergency (a password typed into a fake page, a payment made to a fraudster, a computer behaving strangely): in the browser guard click **Emergency: get help now**. It goes to the top of the SecureMe security team's screen.

For anything else, email **support@realdatatech.ae** or use **Contact support** at the bottom right of https://secureme.realdatatech.ae. If a step fails, copy the exact message you see and include it.
